Ex.No:1a   **Encryption and Decryption Using Ceaser Cipher**

Date:

Aim:

To encrypt and decrypt the given message by using Ceaser Cipher encryption algorithm.

Algorithm:
1. In Ceaser Cipher each letter in the plaintext is replaced by a letter some fixed number of positions down the alphabet.
2. For example, with a **left shift of 3**, **D** would be replaced by **A**, **E** would become **B**, and so on.
3. The encryption can also be represented using modular arithmetic by first transforming the letters into numbers, according to the scheme, **A = 0, B = 1, Z = 25.**
4. Encryption of a letter x by a shift n can be described mathematically as, $En(x) = (x + n) \, mod26$
5. Decryption is performed similarly, $Dn \, (x)=(x - n) \, mod26$

Program:

```
public class CeaserCipher {

public static String encode(String enc, int offset) {

offset = offset % 26 + 26;

StringBuilder encoded = new StringBuilder();

for (char i : enc.toCharArray()) {

if (Character.isLetter(i)) {

if (Character.isUpperCase(i)) {

encoded.append((char) ('A' + (i - 'A' + offset) % 26));

} else {

encoded.append((char) ('a' + (i - 'a' + offset) % 26));

}

} else {

encoded.append(i);

}
```
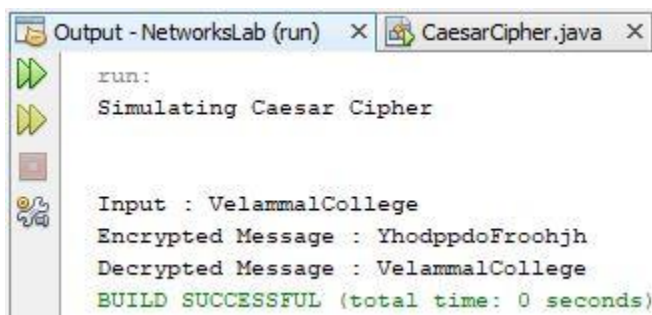

Name: Swetha M
Roll No: 18cse028

```
}

returnencoded.toString();

}

public static String decode(String enc, int offset) {

return encode(enc, 26 - offset);

}

public static void main(String[] args) throws java.lang.Exception {

String msg = "Velammal College";

System.out.println("Simulating Caesar Cipher\n----------------------");

System.out.println("Input :" + msg);

System.out.printf("Encrypted Message : ");

System.out.println(CeaserCipher.encode(msg, 3));

System.out.printf("Decrypted Message : ");

System.out.println(CeaserCipher.decode(CeaserCipher.encode(msg, 3), 3));

}

}
```

Output:

Result:

Thus the program for CeaserCipher encryption and decryption algorithm has been implemented and the output verified successfully.

Ex.No:1b   **Encryption and Decryption Using Playfair Cipher**

Date:

Aim:

   To implement a program to encrypt a plain text and decrypt a cipher text using play fair Cipher substitution technique.

Algorithm:
   1. To encrypt a message, one would break the message into digrams (groups of 2 letters)
   2. For example, "HelloWorld" becomes "HE LL OW OR LD".
   3. These digrams will be substituted using the key table.
   4. Since encryption requires pairs of letters, messages with an odd number of characters usually append an uncommon letter, such as "X", to complete the final digram.
   5. The two letters of the digram are considered opposite corners of a rectangle in the key table. To perform the substitution, apply the following 4 rules, in order, to each pair of letters in the plaintext

Program:

importjava.awt.Point;

classplayfairCipher {

private static char[][] charTable;

private static Point[] positions;

private static String prepareText(String s, booleanchgJtoI) {

s = s.toUpperCase().replaceAll("[^A-Z]","");

returnchgJtoI ? s.replace("J","I") : s.replace("Q", "");

}

private static void createTbl(String key, booleanchgJtoI) {

charTable = new char[5][5];

positions = new Point[26];

String s = prepareText(key + "ABCDEFGHIJKLMNOPQRSTUVWXYZ",

chgJtoI);

Name: Swetha M
Roll No: 18cse028

```java
intlen = s.length();

for (inti = 0, k = 0; i<len; i++) {

char c = s.charAt(i);

if (positions[c - 'A'] == null) {

charTable[k / 5][k % 5] = c;

positions[c - 'A'] = new Point(k % 5, k / 5);

k++;

}

}

}

private static String codec(StringBuilder txt, intdir) {

intlen = txt.length();

for (inti = 0; i<len; i += 2) {

char a = txt.charAt(i);

Ex.No:1c   **Encryption and Decryption Using Hill Cipher**
Date:

Aim:

      To implement a program to encrypt and decrypt using the Hill cipher substitution technique

Algorithm:
1. In the Hill cipher Each letter is represented by a number modulo 26.
2. To encrypt a message, each block of n letters is multiplied by an invertible *n x n* matrix, again *modulus 26*.
3. To decrypt the message, each block is multiplied by the inverse of the matrix used for encryption.
4. The matrix used for encryption is the cipher key, and it should be chosen randomly from the *set of invertible n × n matrices (modulo 26).*
5. The cipher can, be adapted to an alphabet with any number of letters.
6. All arithmetic just needs to be done modulo the number of letters instead of modulo 26.

Program:

```
classhillCipher {

   /* 3x3 key matrix for 3 characters at once */

   public static int[][] keymat = new int[][] { { 1, 2, 1 }, { 2, 3, 2 },

{ 2, 2, 1 } }; /* key inverse matrix */

   public static int[][] invkeymat = new int[][] { { -1, 0, 1 }, { 2, -1, 0 }, { -2, 2, -1 } };

public static String key = "ABCDEFGHIJKLMNOPQRSTUVWXYZ";

Roll No: 18cse028

Ex.No:1d   **Encryption and Decryption Using Vigenere Cipher**

Date:

Aim:

To implement a program for encryption and decryption using vigenere cipher substitution technique

Algorithm:
1. The Vigenere cipher is a method of encrypting alphabetic text by using a series of different Caesar ciphers based on the letters of a keyword.
2. It is a simple form of *polyalphabetic* substitution.
3. To encrypt, a table of alphabets can be used, termed a Vigenere square, or Vigenere table.
4. It consists of the alphabet written out 26 times in different rows, each alphabet shifted cyclically to the left compared to the previous alphabet, corresponding to the 26 possible Caesar ciphers.
5. At different points in the encryption process, the cipher uses a different alphabet from one of the rows used.
6. The alphabet at each point depends on a repeating keyword.

Program:

```
public class vigenereCipher {

static String encode(String text, final String key) {

String res = "";

text = text.toUpperCase();

for (inti = 0, j = 0; i<text.length(); i++) {

char c = text.charAt(i);

if (c < 'A' || c > 'Z') {

continue;

}

res += (char) ((c + key.charAt(j) - 2 * 'A') % 26 + 'A');

j = ++j % key.length();
```
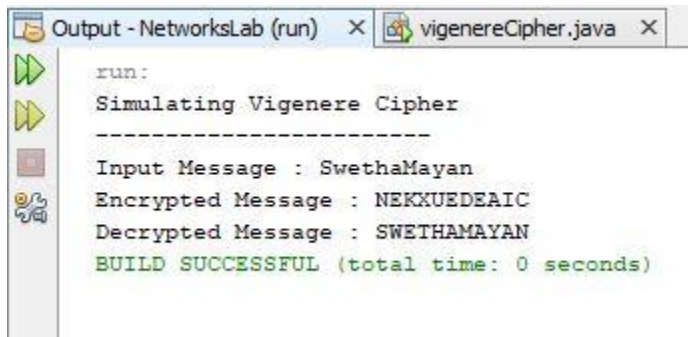

Name: Swetha M
Roll No: 18cse028

```java
        }
        return res;
    }
    static String decode(String text, final String key) {
        String res ="";
        text = text.toUpperCase();

        for (inti = 0, j = 0; i<text.length(); i++) {
            char c = text.charAt(i);
            if (c < 'A' || c > 'Z') {
                continue;
            }
            res += (char) ((c - key.charAt(j) + 26) % 26 + 'A');
            j = ++j % key.length();
        }
        return res;
    }
    public static void main(String[] args) throws java.lang.Exception {
        String key = "VIGENERECIPHER";
        String msg = "ComputerLaboratory";
        System.out.println("Simulating Vigenere Cipher\n----------------------");
        System.out.println("Input Message : " + msg);
        String enc = encode(msg, key);
        System.out.println("Encrypted Message : " + enc);
        System.out.println("Decrypted Message : " + decode(enc, key));
    }}
```

Ex.No:2a   RAIL FENCE CIPHER TRANSPOSITIONTECHNIQUE

Date:

Aim:

      To implement a program for encryption and decryption using rail fence transposition technique.

Algorithm:
1. In the rail fence cipher, the plaintext is written downwards and diagonally on successive "rails" of an imaginary fence, then moving up when we reach the bottom rail
2. When we reach the top rail, the message is written downwards again until the whole plaintext is written out.
3. The message is then read off in rows.

Program:

packagerailfencecipher;

classrailfenceCipherHelper {

int depth;

   String encode(String msg, int depth) throws Exception {

int r = depth;

int l = msg.length();

int c = l / depth;

int k = 0;

char mat[][] = new char[r][c];

    String enc = "";

for (inti = 0; i< c; i++) {

for (int j = 0; j < r; j++) {

if (k != l) {

mat[j][i] = msg.charAt(k++);

     } else {

mat[j][i] = 'X';

Name: Swetha M
Roll.No:18cse028

```java
            }
          }
        }
for (inti = 0; i< r; i++) {
for (int j = 0; j < c; j++) {
enc += mat[i][j];
          }
        }
returnenc;
    }
    String decode(String encmsg, int depth) throws Exception {
int r = depth;
int l = encmsg.length();
int c = l / depth;
int k = 0;
char mat[][] = new char[r][c];
        String dec = "";
for (inti = 0; i< r; i++) {
for (int j = 0; j < c; j++) {
mat[i][j] = encmsg.charAt(k++);
          }
        }
for (inti = 0; i< c; i++) {

Ex No: 5   **RSA Algorithm**

Date:

Aim:
     To implement RSA (Rivest–Shamir–Adleman) algorithm by using HTML and JavaScript.

Algorithm:
1. Choose two prime number p and q
2. Compute the value of n and **p**
3. Find the value of e (public key)
4. Compute the value of d (private key) using gcd()
5. Do the encryption and decryption
   a. Encryption is given as,
      $c = t^e \bmod n$
   b. Decryption is given as,
   $t = c^d \bmod n$

Ex No: 6   **Diffie-Hellman key exchange algorithm**

Date:

Aim:

To implement the Diffie-Hellman Key Exchange algorithm for a given problem .

Algorithm:

1. Alice and Bob publicly agree to use a modulus $p = 23$ and base $g = 5$ (which is a primitive root modulo 23).
2. Alice chooses a secret integer $a = 4$, then sends Bob $A = g^a$ mod p
   - $A = 5^4$ mod 23 = 4
3. Bob chooses a secret integer $b = 3$, then sends Alice $B = g^b$ mod p
   - $B = 5^3$ mod 23 = 10
4. Alice computes $s = B^a$ mod p
   - $s = 10^4$ mod 23 = 18
5. Bob computes $s = A^b$ mod p
   - $s = 4^3$ mod 23 = 18
6. Alice and Bob now share a secret (the number 18).

Program:

class DiffieHellman {

   public static void main(String args[]) {

      int p = 27; /* publicly known (prime number) */

      int g = 5; /* publicly known (primitive root) */

      int x = 2; /* only Alice knows this secret */

      int y = 3; /* only Bob knows this secret */

      double aliceSends = (Math.pow(g, x)) % p;

      double bobComputes = (Math.pow(aliceSends, y)) % p;

      double bobSends = (Math.pow(g, y)) % p;

Name: Swetha M
Roll No: 18cse028

```java
        double aliceComputes = (Math.pow(bobSends, x)) % p;

        double sharedSecret = (Math.pow(g, (x * y))) % p;

        System.out.println("simulation of Diffie-Hellman key exchange algorithm\n--
------------------------------------------");

        System.out.println("Alice Sends : " + aliceSends);

        System.out.println("Bob Computes : " + bobComputes);

        System.out.println("Bob Sends : " + bobSends);

        System.out.println("Alice Computes : " + aliceComputes);

        System.out.println("Shared Secret : " + sharedSecret);

        /* shared secrets should match and equality is transitive */

        if ((aliceComputes == sharedSecret) && (aliceComputes == bobComputes))

            System.out.println("Success: Shared Secrets Matches! " + sharedSecret);

        else

            System.out.println("Error: Shared Secrets does not Match");

    }

}
```

Output:

```
run:
simulation of Diffie-Hellman key exchange algorithm
-----------------------------------------
Alice Sends : 25.0
Bob Computes : 19.0
Bob Sends : 17.0
Alice Computes : 19.0
Shared Secret : 19.0
Success: Shared Secrets Matches! 19.0
BUILD SUCCESSFUL (total time: 0 seconds)

Ex No: 8   **Digital Signature Standard**

Date:

Aim:

To implement the SIGNATURE SCHEME - Digital Signature Standard.

Algorithm:
1. Create a KeyPairGenerator object.
2. Initialize the KeyPairGenerator object.
3. Generate the KeyPairGenerator. ...
4. Get the private key from the pair.
5. Create a signature object.
6. Initialize the Signature object.
7. Add data to the Signature object
8. Calculate the Signature

Program:

```
import java.security.KeyPair;

import java.security.KeyPairGenerator;

import java.security.PrivateKey;

import java.security.Signature;

import java.util.Scanner;

public class DigitalSign {

  public static void main(String args[]) throws Exception {

Scanner sc = new Scanner(System.in);

    System.out.println("Enter some text");

    String msg = sc.nextLine();

    KeyPairGenerator keyPairGen = KeyPairGenerator.getInstance("DSA");

    keyPairGen.initialize(2048);
```

Name: Swetha M
Roll No: 18cse028

```java
    KeyPair pair = keyPairGen.generateKeyPair();

    PrivateKey privKey = pair.getPrivate();

    Signature sign = Signature.getInstance("SHA256withDSA");

    sign.initSign(privKey);

    byte[] bytes = "msg".getBytes();

    sign.update(bytes);

    byte[] signature = sign.sign();

    System.out.println("Digital signature for given text: "+new String(signature,
"UTF8"));

  }

}
```

Output:

```
run:
Enter some text
i love india
Digital signature for given text: 0<   □□f□5□6 Tw  |□.□'.'=□
q□□   7   ⁿbC aH□□K}2□□□v□t□□□1

Name: Swetha M
Roll No: 18cse028

Ex No: 9   **Demonstration of Intrusion Detection System(IDS)**

Date:

Aim:

To demonstrate Intrusion Detection System (IDS) using Snort software tool.

Steps on Configuring and Intrusion Detection:

1. Download Snort from the Snort.org website. (http://www.snort.org/snort-downloads)
2. Download Rules(https://www.snort.org/snort-rules). You must register to get the rules. (You should download these often)
3. Double click on the .exe to install snort. This will install snort in the "C:\Snort" folder.It is important to have WinPcap (https://www.winpcap.org/install/) installed
4. Extract the Rules file. You will need WinRAR for the .gz file.
5. Copy all files from the "rules" folder of the extracted folder. Now paste the rules into *"C:\Snort\rules"* folder.
6. Copy "snort.conf" file from the "etc" folder of the extracted folder. You must paste it into "C:\Snort\etc" folder. Overwrite any   existing file. Remember if you modify your snort.conf file and download a new file, you must modify it for Snort to work.
7. Open a command prompt (cmd.exe) and navigate to folder "C:\Snort\bin" folder. (at the Prompt, type cd\snort\bin)
8. To start (execute) snort in sniffer mode use following command:
snort -dev -i 3
-i indicates the interface number. You must pick the correct interface number. In my case, it is 3.
 -dev is used to run snort to capture packets on your network.

To check the interface list, use following command:
 snort   -W

Finding an interface

Name: Swetha M
Roll No: 18cse028

You can tell which interface to use by looking at the Index number and finding Microsoft. As you can see in the above example, the other interfaces are for VMWare. My interface is 3.

9. To run snort in IDS mode, you will need to configure the file "snort.conf" according to your network environment.
10. To specify the network address that you want to protect in snort.conf file, look for the following line.
var HOME_NET 192.168.1.0/24 (You will normally see any here)
11. You may also want to set the addresses of DNS_SERVERS, if you have some on your network.

Example:

example snort
12. Change the RULE_PATH variable to the path of rules folder.
 var RULE_PATH c:\snort\rules

path to rules

Name: Swetha M
Roll No: 18cse028

13. Change the path of all library files with the name and path on your system. and you must change the path   of snort_dynamicpreprocessorvariable.
C:\Snort\lib\snort_dynamiccpreprocessor
You need to do this to all library files in the "C:\Snort\lib" folder. The old path might be: "/usr/local/lib/…". you will need to   replace that path with your system path. Using C:\Snort\lib
14. Change the path of the "dynamicengine" variable value in the "snort.conf" file..
Example:
 dynamicengine C:\Snort\lib\snort_dynamicengine\sf_engine.dll

15 Add the paths for "include classification.config" and "include reference.config" files.
   include c:\snort\etc\classification.config
include c:\snort\etc\reference.config
16. Remove the comment (#) on the line to allow ICMP rules, if it is commented with a #.
 include $RULE_PATH/icmp.rules
17. You can also remove the comment of ICMP-info rules comment, if it is commented.
 include $RULE_PATH/icmp-info.rules
18. To add log files to store alerts generated by snort, search for the "output log" test in snort.conf and add the following line:
output alert_fast: snort-alerts.ids
19. Comment (add a #) the whitelist $WHITE_LIST_PATH/white_list.rules and the blacklist

Change the nested_ip inner , \ to nested_ip inner #, \
20. Comment out (#) following lines:
#preprocessor normalize_ip4
#preprocessor normalize_tcp: ips ecn stream
#preprocessor normalize_icmp4
#preprocessor normalize_ip6
#preprocessor normalize_icmp6

Name: Swetha M
Roll No: 18cse028

21. Save the "snort.conf" file.
22. To start snort in IDS mode, run the following command:

snort -c c:\snort\etc\snort.conf -l c:\snort\log -i 3
(Note: 3 is used for my interface card)

If a log is created, select the appropriate program to open it. You can use WordPard or NotePad++ to read the file.

To generate Log files in ASCII mode, you can use following command while running snort in IDS mode:
snort -A console -i3 -c c:\Snort\etc\snort.conf -l c:\Snort\log -K ascii

23. Scan the computer that is running snort from another computer by using PING or NMap (ZenMap).

After scanning or during the scan you can check the snort-alerts.ids file in the log folder to insure it is logging properly. You will see IP address folders appear.

Ex No: 10   Exploring N-Stalker, a Vulnerability Assessment Tool

Date:

Aim:

To download the N-Stalker Vulnerability Assessment Tool and exploring the features.

Exploring N-Stalker:
- N-Stalker Web Application Security Scanner is a Web security assessment tool.
- It incorporates with a well-known N-Stealth HTTP Security Scanner and 35,000 Web attack signature database.
- This tool also comes in both free and paid version.
- Before scanning the target, go to "License Manager" tab, perform the update.
- Once update, you will note the status as up to date.
- You need to download and install N-Stalker from www.nstalker.com.
  1. Start N-Stalker from a Windows computer. The program is installed under Start ⇨ Programs ⇨ N-Stalker ⇨ N-Stalker Free Edition.
  2. Enter a host address or a range of addresses to scan.
  3. Click Start Scan.
  4. After the scan completes, the N-Stalker Report Manager will prompt
  5. you to select a format for the resulting report as choose Generate HTML.
  6. Review the HTML report for vulnerabilities.
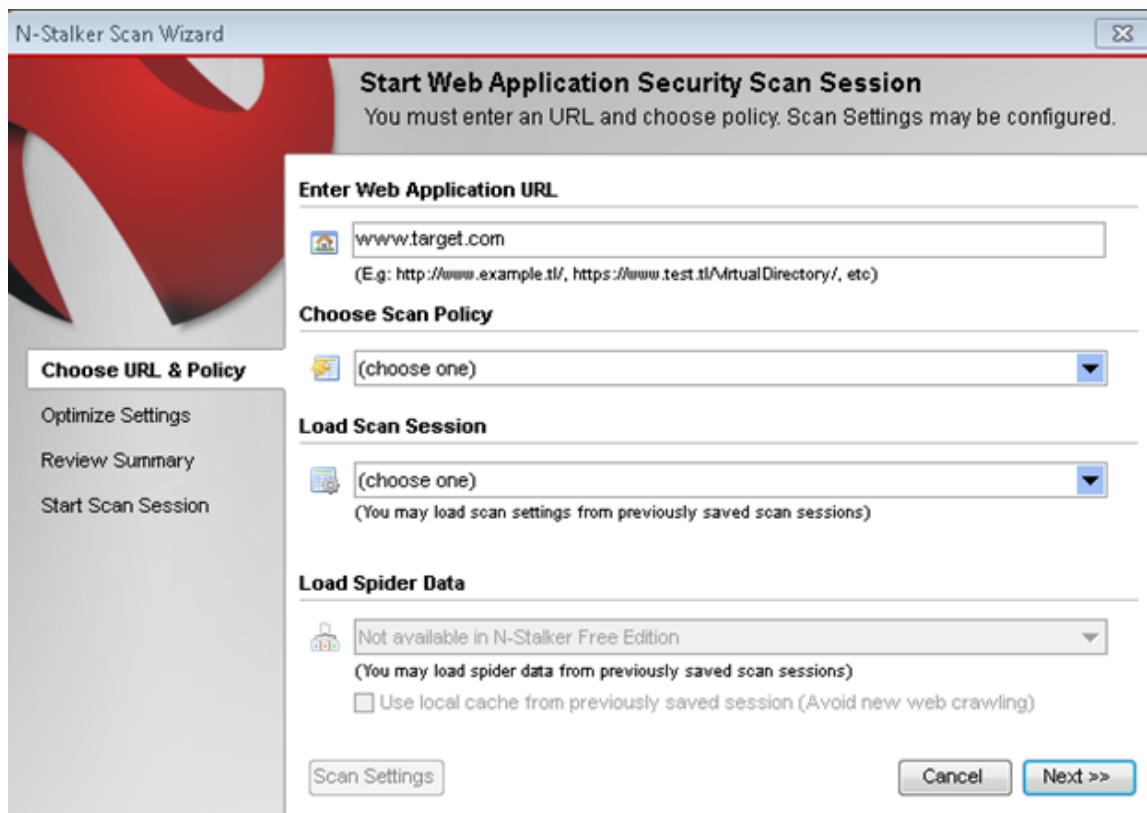

Name: Swe
Roll No: 18

Now goto "Scan Session", enter the target URL.
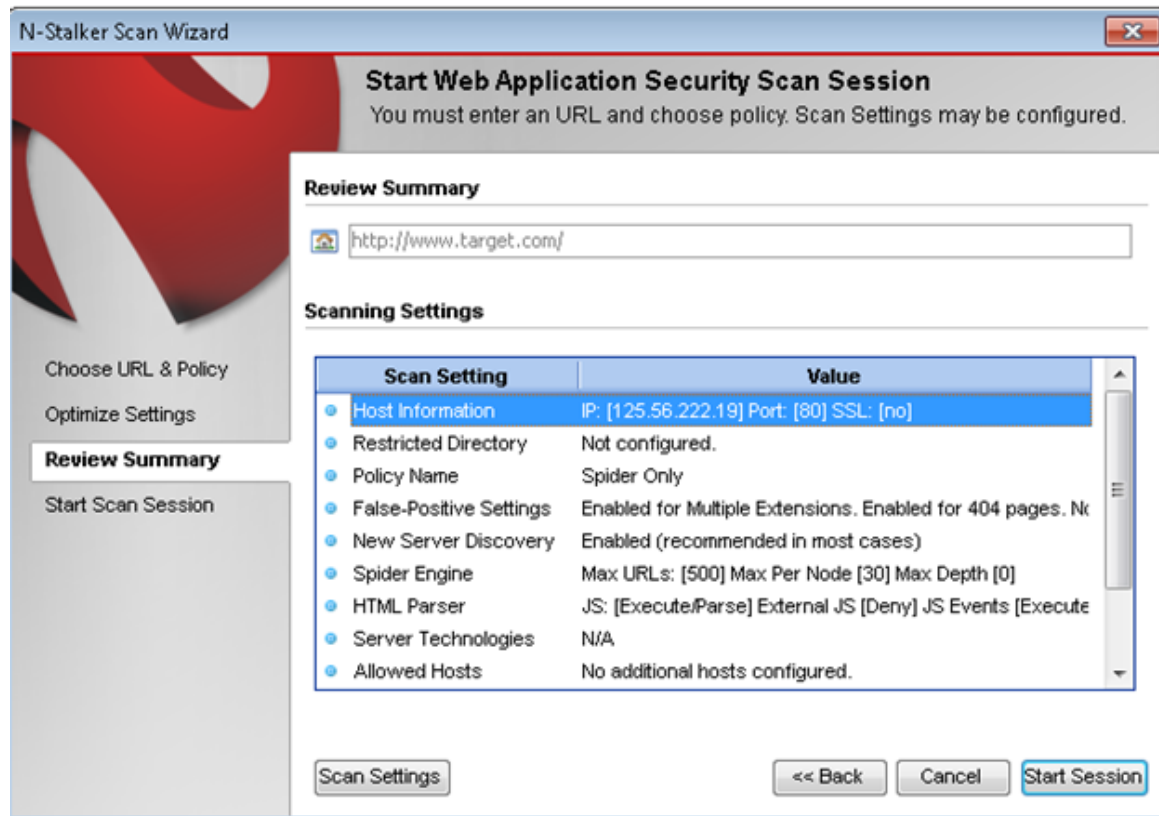

In scan policy, you can select from the four options,
- Manual test which will crawl the website and will be waiting for manual attacks.
- full xss assessment
- owasp policy
- Web server infrastructure analysis.

Once, the option has been selected, next step is "Optimize settings" which will crawl the whole website for further analysis.

In review option, you can get all the information like host information, technologies used, policy name, etc.

Name: Swetha M
Roll No: 18cse028

Once done, start the session and start the scan.

The scanner will crawl the whole website and will show the scripts, broken pages, hidden fields, information leakage, web forms related information which helps to analyze further.

Name: Swetha M
Roll No: 18cse028

Once the scan is completed, the NStalker scanner will show details like severity level, vulnerability class, why is it an issue, the fix for the issue and the URL which is vulnerable to the particular vulnerability?

Name: Swetha M
Roll No: 18cse028

Ex.No:11a   **Defeating Malware - Building Trojans**

Date:

Aim:

To build a Trojan and know the harmness of the trojan malwares in a computer system.

Procedure:
1. Create a simple trojan by using Windows Batch File (*.bat*)
2. Type these below code in notepad and save it as **Trojan.bat**
3. Double click on *Trojan.bat*file.
4. When the trojan code executes, it will open MS-Paint, Notepad, Command Prompt, Explorer, etc., infinitely.
5. Restart the computer to stop the execution of this trojan.

Trojan:
- In computing, a Trojan horse,or trojan, is any malware which misleads users of its true intent.

- Trojans are generally spread by some form of social engineering, for example where a user is duped into executing an email attachment disguised to appear not suspicious, (e.g., a routine form to be filled in), or by clicking on some fake advertisement on social media or anywhere else.

- Although their payload can be anything, many modern forms act as a backdoor, contacting a controller which can then have unauthorized access to the affected computer.
- Trojans may allow an attacker to access users' personal information such as banking information, passwords, or personal identity.

- *Example:Ransomware* attacks are often carried out using a *trojan*.

Code:
Trojan.bat
```
@echo off
:x
start mspaint
```

Name: Swetha M
Roll No: 18cse028

start notepad
start cmd
start explorer
start control
start calc
goto x

Output:
(MS-Paint, Notepad, Command Prompt, Explorer will open infinitely)

Result:
      Thus a trojan has been built and the harmness of the trojan viruses has been explored.

Roll No: 18cse028

Ex No: 11b   **Defeating Malware - Rootkit hunter**

Date:

Aim:

To install a rootkit hunter and find the malwares in a computer.

Rootkit Hunter:
- rkhunter (Rootkit Hunter) is a Unix-based tool that scans for rootkits, backdoors and possible local exploits.
- It does this by comparing SHA-1 hashes of important files with known good ones in online databases, searching for default directories (of rootkits), wrong permissions, hidden files, suspicious strings in kernel modules, and special tests for Linux and FreeBSD.
- rkhunter is notable due to its inclusion in popular operating systems (Fedora, Debian, etc.)
- The tool has been written in Bourne shell, to allow for portability. It can run on almost all UNIX-derived systems.

GMER Rootkit Tool:
- GMER is a software tool written by a Polish researcher Przemysław Gmerek, for detecting and removing rootkits.
- It runs on Microsoft Windows and has support for Windows NT, 2000, XP, Vista, 7, 8 and 10. With version 2.0.18327 full support for Windows x64 is added.

Step 1

Name: Swetha M
Roll No: 18cse028

Visit GMER's website (see Resources) and download the GMER executable.

Click the "Download EXE" button to download the program with a random file name, as some rootkits will close "gmer.exe" before you can open it.

Step 2

Double-click the icon for the program.

Click the "Scan" button in the lower-right corner of the dialog box. Allow the program to scan your entire hard drive.

Name: Swetha M
Roll No: 18cse028

Step 3

When the program completes its scan, select any program or file listed in red. Right-click it and select "Delete."

If the red item is a service, it may be protected. Right-click the service and select "Disable." Reboot your computer and run the scan again, this time selecting "Delete" when that service is detected.

When your computer is free of Rootkits, close the program and restart your PC.

Observation	
Record	
Total	

Result:

Thus the experiment a rootkit hunter software tool has been installed and the rootkits have been detected.
